

Adding Cisco IOL to EVE-NG

- First download the .bin files from [here](#) or [here](#). Most probably the file names will be:
 - i86bi_linux_l2-adventerprisek9-ms.SSA.high_iron_20190423.bin This will be the one for Switch Layer-2 device
 - i86bi_LinuxL3-AdvEnterpriseK9-M2_157_3_May_2018.bin This will be for a router i.e. Layer-3 device
- Further you need to paste these into the **"/opt/unetlab/addons/iol/bin"** using the FTP client, I used WinSCP as follows:
 - First of all you need to know the ip of your EVE-NG machine that you are running using Virtual Box (the one that you used to get access in the browser), in my case it is [192.168.1.190](#) (statically given)

- Once you have entered the required details, and connected to eve-ng, you will be able to see the contents as shown in the image above.

- Then, in order to transfer the files, you can just navigate to the desired directory and drag the item(s) from green part to the orange part, and you have completed the file transfer.

Creating a IOURC license file...

- Copy the code given below and name the file [gen.py](#) (You can give this file any name as per your convenience, but remember to keep the extension as .py , python will be able to run this file when given the command to do so) (The code has been taken from other available resources)

```
#!/usr/bin/python
print("*****")
print("Cisco IOU License Generator - Kal 2011, python port of 2006 C version")
print("Modified to work with python3 by c_d 2014")
import os
import socket
import hashlib
import struct

# get the host id and host name to calculate the hostkey
hostid=os.popen("hostid").read().strip()
hostname = socket.gethostname()
ioukey=int(hostid,16)
for x in hostname:
    ioukey = ioukey + ord(x)
print("hostid=" + hostid + ", hostname=" + hostname + ", ioukey=" + hex(ioukey)[2:])

# create the license using md5sum
iouPad1 = b'\x4B\x58\x21\x81\x56\x7B\x0D\xF3\x21\x43\x9B\x7E\xAC\x1D\xE6\x8A'
iouPad2 = b'\x80' + 39*b'\0'
md5input=iouPad1 + iouPad2 + struct.pack('!i', ioukey) + iouPad1
iouLicense=hashlib.md5(md5input).hexdigest()[:16]

print("\nAdd the following text to ~/.iourc:")
print("[license]\n" + hostname + " = " + iouLicense + ";\n")
print("You can disable the phone home feature with something like:")
print(" echo '127.0.0.127 xml.cisco.com' >> /etc/hosts\n")
```

- transfer this [gen.py](#) file into the same directory where you moved the .bin files in the earlier steps
- Now move to the EVE-NG CLI, and navigate to **“/opt/unetlab/addons/iol/bin”** where you have kept the .py file and other .bin files. This can be done using

```
cd /opt/unetlab/addons/iol/bin
```

- Now use the following command to run the .py file you just moved into “/opt/unetlab/addons/iol/bin”

```
python gen.py
```

- Your output will be like this:

```
eve-comm-vm-test123 [Running] - Oracle VM VirtualBox
File Machine View Input Devices Help
root@eve-ng-test:/opt/unetlab/addons/iol/bin# python gen.py
*****
Cisco IOU License Generator - Kal 2011, python port of 2006 C version
Modified to work with python3 by c_d 2014
} hostname=eve-ng-test, ioukey=7f0530

Add the following text to ~/.iourc:
[license]
eve-ng-test = 8f5d9c2762fe0734;

You can disable the phone home feature with something like:
echo '127.0.0.127 xml.cisco.com' >> /etc/hosts

root@eve-ng-test:/opt/unetlab/addons/iol/bin#
```

**Note: Do not use the exact same output shown here
Please use your own, the output for your files might be different
And using this output might not allow it to work correctly**

- now you need to make a iourc file
in “**/opt/unetlab/addons/iol/bin**” directory, you can do the same using

```
nano -c iourc
```

```
[license]  
"your hostname" = "the key out put the program that you ran";
```

- NOTE: I think you should not forget the semi-colon (;) at the end
- after typing this into the file you need to press Ctrl+O in order to save the file, read the next message and type Y to confirm the filename and at last press Ctrl+X to close the nano editor.
- You have completed the process, now you can type “ls” to see the contents, and you will have the following view.

```
eve-comm-vm-test123 [Running] - Oracle VM VirtualBox
File Machine View Input Devices Help
root@eve-ng-test:~# cd /opt/unetlab/addons/iol/bin/
root@eve-ng-test:/opt/unetlab/addons/iol/bin# ls
gen.py
i86bi_linux_12-adventerprisek9-ms.SSA.high_iron_20190423.bin
i86bi_LinuxL3-AdvEnterpriseK9-M2_157_3_May_2018.bin
iourc
root@eve-ng-test:/opt/unetlab/addons/iol/bin#
```

- Now your router and switch should be working perfectly in your simulation environment (that you access in your browser using the ip of your EVE-NG machine)
- You also have to run the following command in order for everything to take effect:

```
/opt/unetlab/wrappers/unl_wrapper -a fixpermissions
```
