

NetBios Enumeration

NetBIOS, short for Network Basic Input/Output System, is a protocol that enables communication between applications on a local area network (LAN). It is commonly used in Windows environments for sharing files, printers, and other resources.

Lets start our enumeration with the Nbtscan tool.

```
nbtscan -v 192.168.29.141 -h
```

- We can also perform Netbios enumeration with the help of nmap.

```
nmap -sV -p 139 --script nbstat.nse 192.168.29.141
```

- Nmblookup is another tool that we can use to perform Netbios enumeration.

```
nmblookup -A 192.168.29.141
```
