

## Advanced Dynamic Scan:

Advanced Dynamic Scan is a specialized scan template in Nessus that allows users to create scans or policies using dynamic plugin filters rather than manually selecting individual plugins or entire plugin families. This approach streamlines the process of targeting specific vulnerabilities or groups of vulnerabilities based on dynamic criteria, such as CVE IDs, plugin names, or other attributes.

Instead of selecting plugins one by one, you define filters (e.g., by CVE, plugin name, severity) to automatically include all relevant plugins that match the criteria. This makes it easier to adapt scans to emerging threats or compliance requirements.

The template does not provide recommendations, giving users full control over which vulnerabilities or checks are included.
