

Malware Scan:

A Malware Scan in Nessus is designed to detect active malware, backdoors, rootkits, and suspicious files or processes running on a system. It's especially effective when combined with credentialed scanning, allowing Nessus to inspect the file system and running processes.

Nessus Malware Scan Process

Web Application Tests:

Web application tests in Nessus focus on identifying vulnerabilities, misconfigurations, and security risks in web applications and APIs. Only focuses on discovering vulnerabilities specific to web apps. These tests are essential for securing custom web apps, APIs, or CMS platforms like WordPress, Joomla, etc.
