

Reports:

In **Nessus**, a **report** is the output or result of a vulnerability scan. Reports are structured documents generated from vulnerability scan results. It contains detailed information about the discovered vulnerabilities, misconfigurations, compliance issues, and more, based on the targets that were scanned.

Report in Nessus:

- o A **report** summarizes the findings of a scan.
- o It shows which vulnerabilities were found.
- o It shows vulnerabilities severity levels and affected systems.
- o It also shows the recommended remediation steps.
- o Documenting security posture for audits or compliance.
- o You can export reports in various formats for analysis, documentation, or sharing.

Format	Description
HTML	User-friendly and interactive report view. Great for management or presentations.
PDF	Formal and printable version of the report. Suitable for compliance or audits.
CSV	Tabular data format ideal for spreadsheets and further data analysis.
