

Information Gathering with BlackWidow

BlackWidow is a Python-based web application spider tool used for information gathering during the initial stages of web application vulnerability assessment. It can automatically collect subdomains, URLs, dynamic parameters, email addresses, and phone numbers from a target website.

To install it, we just have to follow the steps on its github repository.

```
git clone https://github.com/1N3/BlackWidow.git  
  
cd BlackWindow  
  
sudo bash install.sh
```

- Fire Blackwidow on the target domain.

```
sudo blackwidow -u https://domain.com
```
